Professional practice: an ethical prospective

Every profession has to ask and try to answer what should be its specific contribution to the common good.

The informal discussion, often one on one, can be very effective in combating ethical dilemmas and ensure continuous professional development.

We must consider the sociological delineations of the sphere of the profession in terms of higher education, formal certification, work full time for a living, labor organization and, of course, the code of ethics.

The professional ethics, according to this proposal, it has to do with the compatibility of professional practice with the core values of social environment. Naturally, we are particularly interested in the values of a democratic background, which reflect basic moral principles of democracy: human dignity, justice and equity.

In addition, radiographers should not seek to formulas to solve problems of professional ethics

Fundamentally, professionalism is the relationship between freedom of professionals to practice and the concomitant responsibility to ethical practice, and all professionals have a crucial role in the practical training by sharing their experiences of ethical guidance.
